LC TPC Workshop
LAL, Orsay, France
January 12, 2005

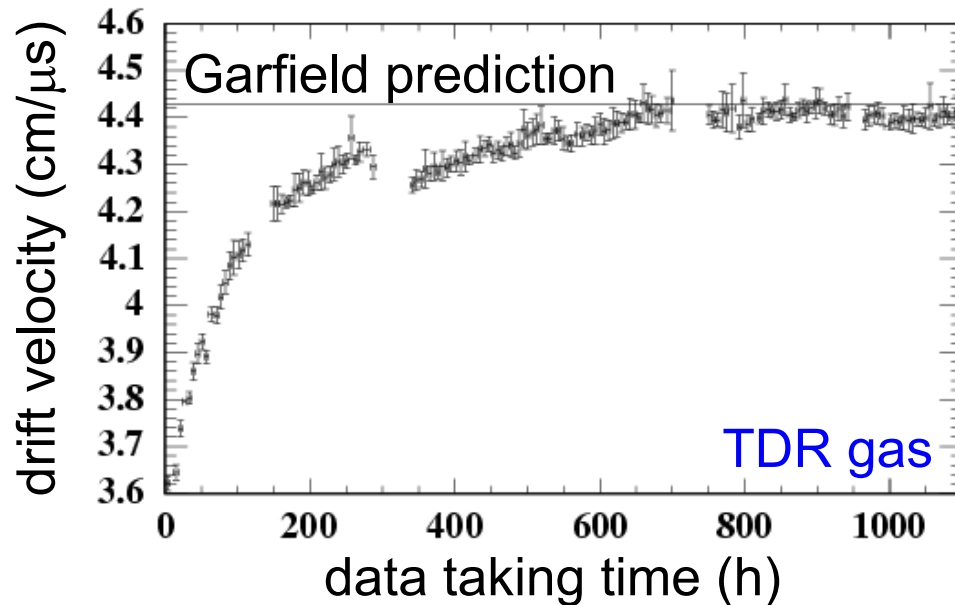

Synopsis: Data Taking in 2004

5 T Magnet:	Electron test beam:
500 000 events	300 000 events
33 %: non-staggered pads, 67 %: staggered pads	100 %: non-staggered pads
80 %: Ar-CH ₄ -CO ₂ (93-5-2), 20 %: Ar-CH ₄ (95-5)	100 %: Ar-CH ₄ -CO ₂ (93-5-2)

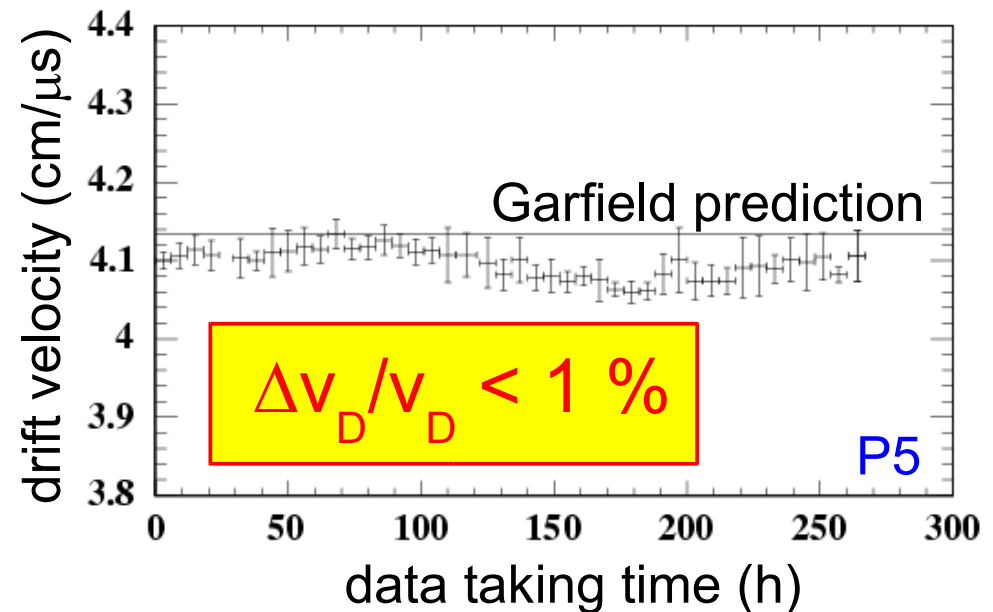

Gas Quality Monitoring

Drift Velocity versus Time

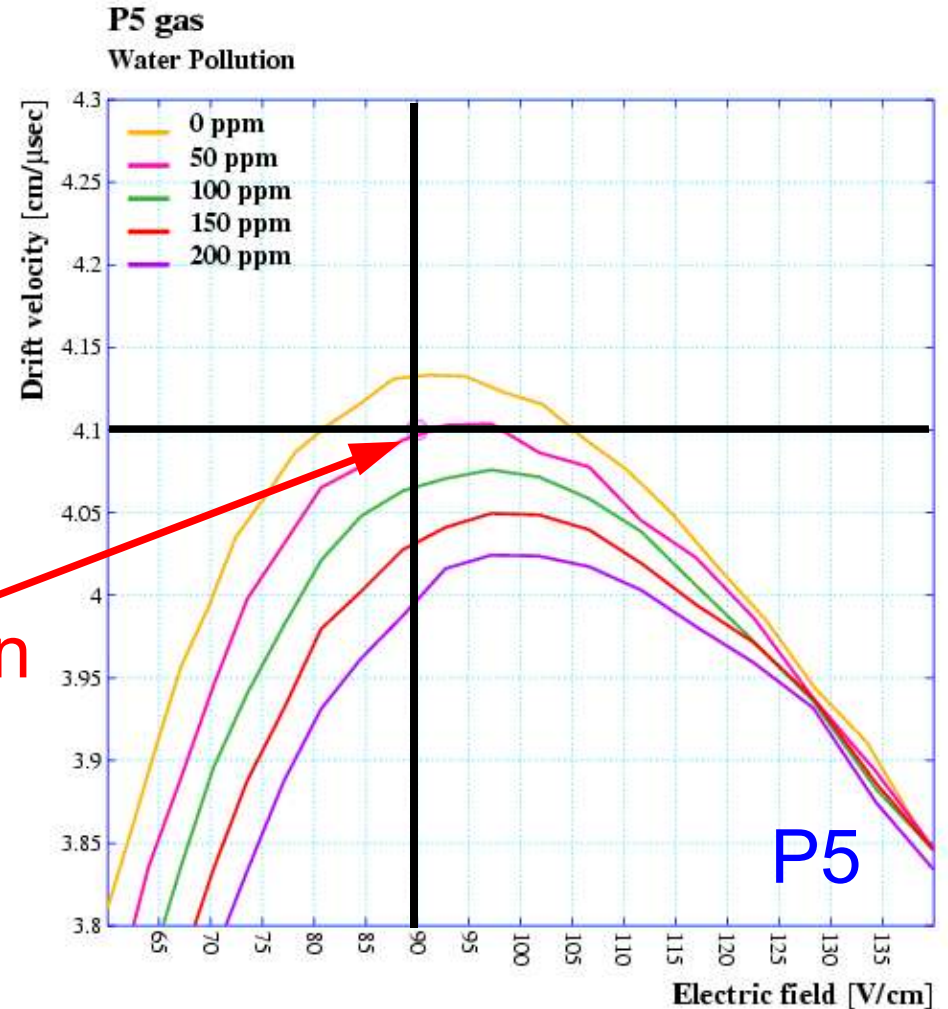

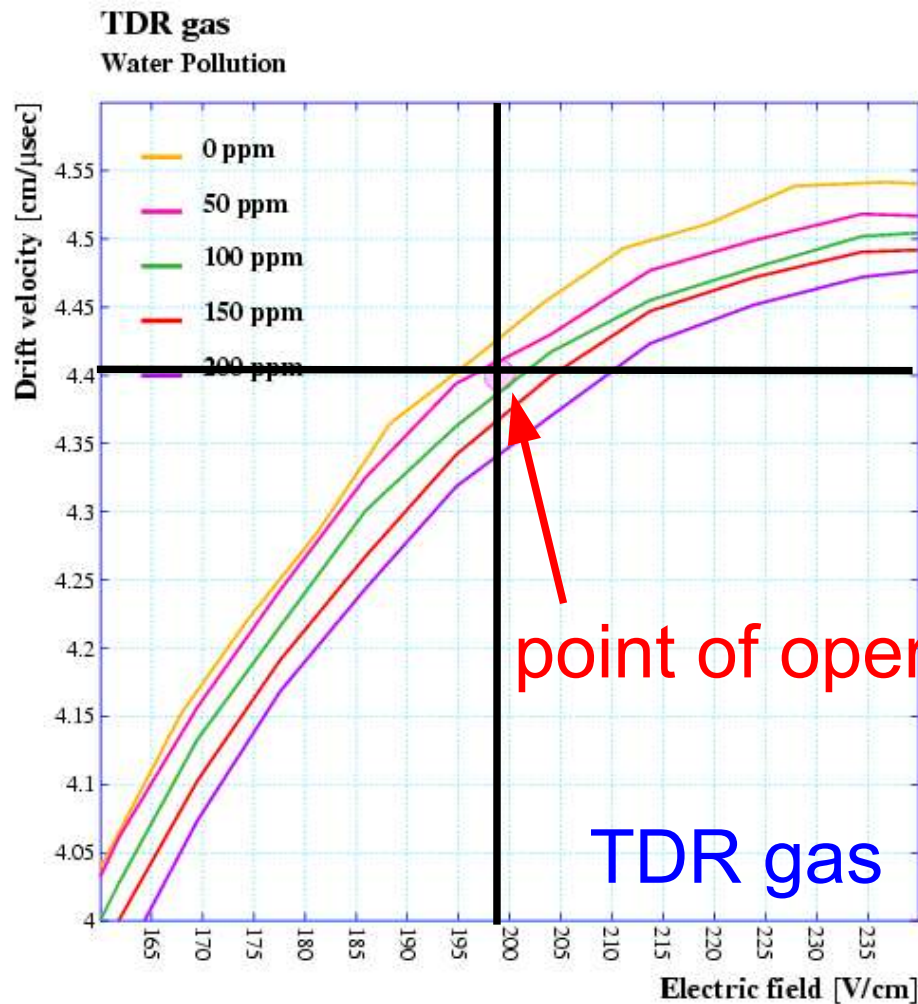

Drift Velocity versus Time

- Large gas contamination at beginning of data taking
- Several hints indicate that water is dominant contributor
- Slow control monitoring system is being built to allow a dedicated analysis of the influence of environmental parameters

Gas Quality Monitoring

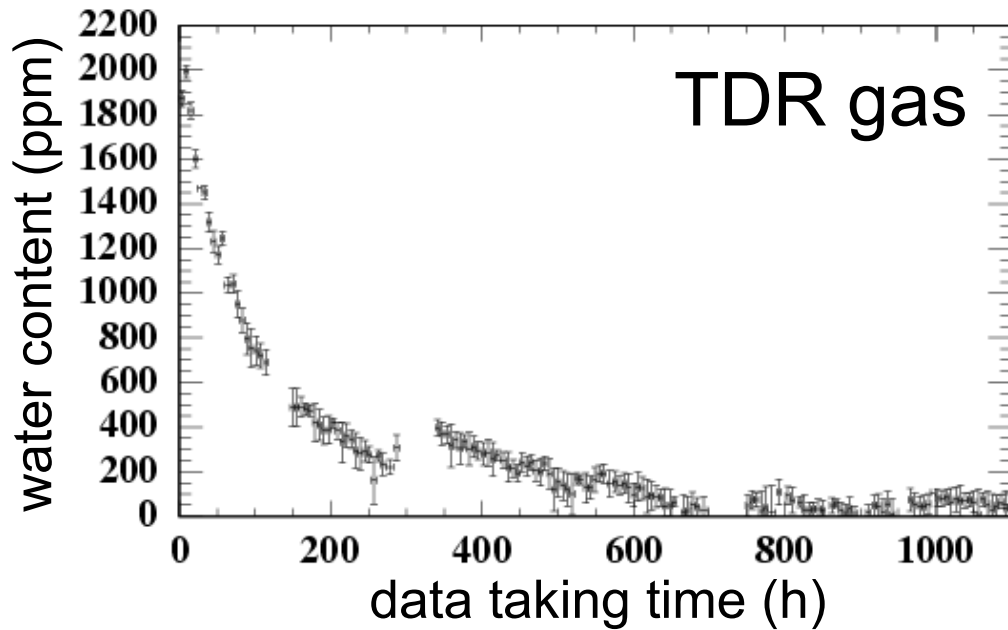

Water interpretation yields ~ 50 ppm water contamination for both gases

Gas Quality Monitoring

Water contamination derived from drift velocity:

Water Content versus Time

Water Content versus Time

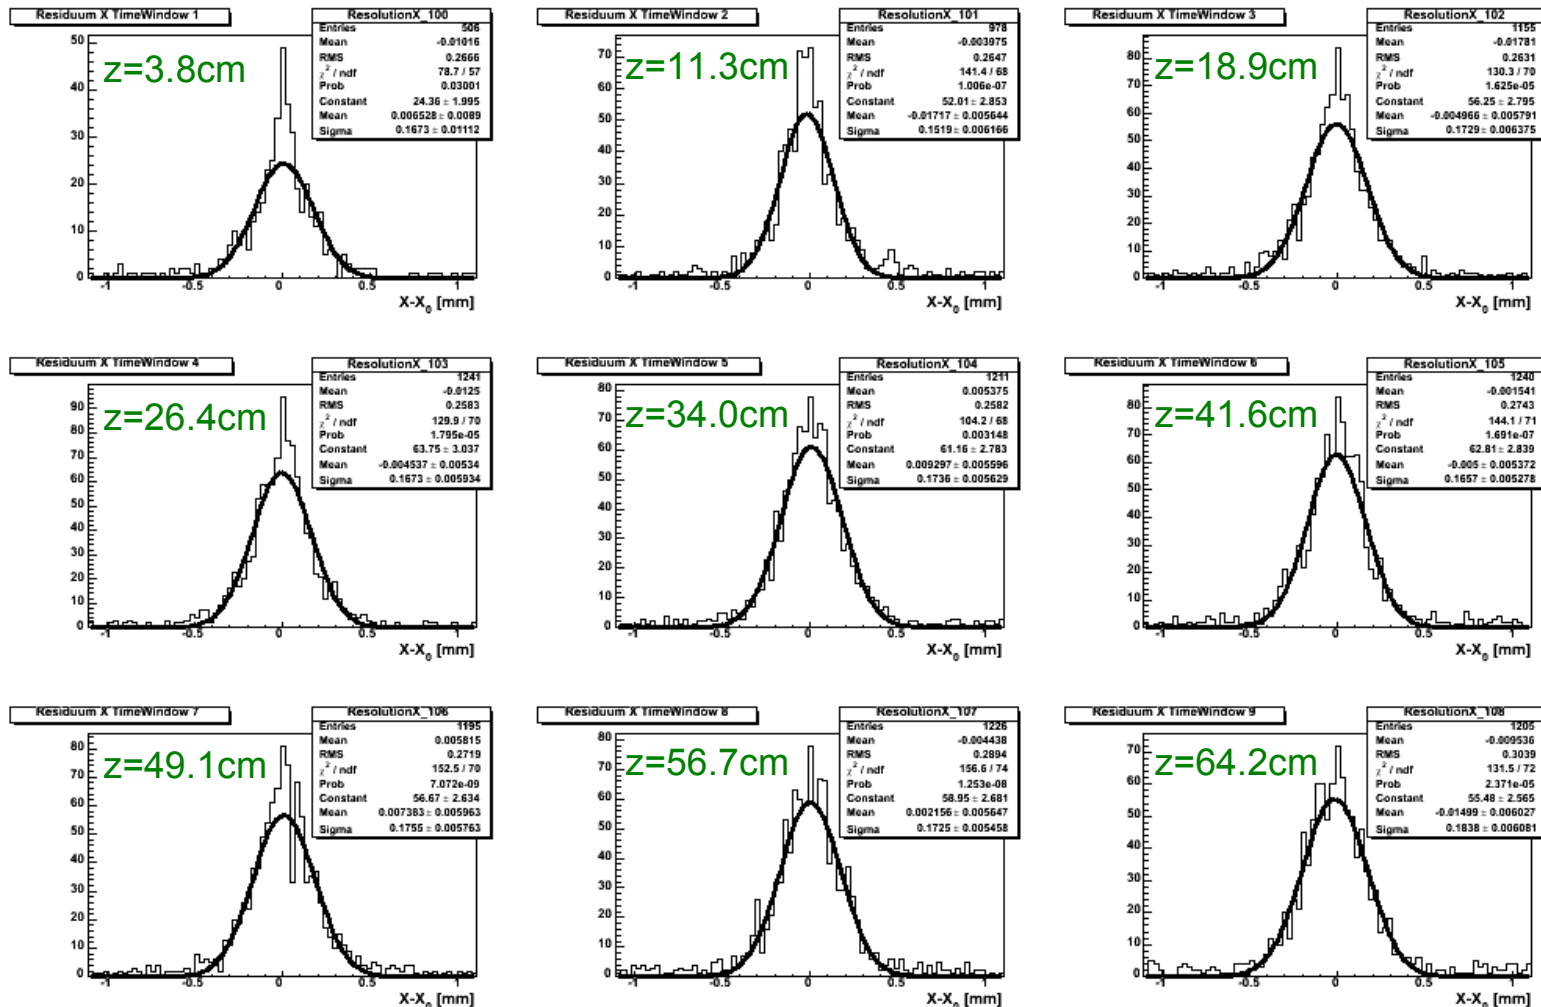

Systematics Studies

Continued study of systematics contributing to resolution measurements:

- Pad response function correction
 - Cut dependence of resolution
 - Biases of different methods to determine resolution
- } in progress

Definition of Resolution?

Residual distributions (2 mm wide, non-staggered pads, B = 4 T):

Definition of Resolution?

Residual distributions (2 mm wide, staggered pads, $B = 4$ T):

Definition of Resolution?

The only easy conclusion:

2 mm pads seem too wide
for TDR-like gases

(to get diffusion limited resolution for all
drift distances with “typical” GEM stack setup)

Triplet Method

Determine residual only from three adjacent pad rows:

- Draw straight line through outer hits
- Determine distance between straight line and central hit
- Resolution σ assuming same uncertainty for all hits: $\sigma = \sigma_d \sqrt{2/3}$

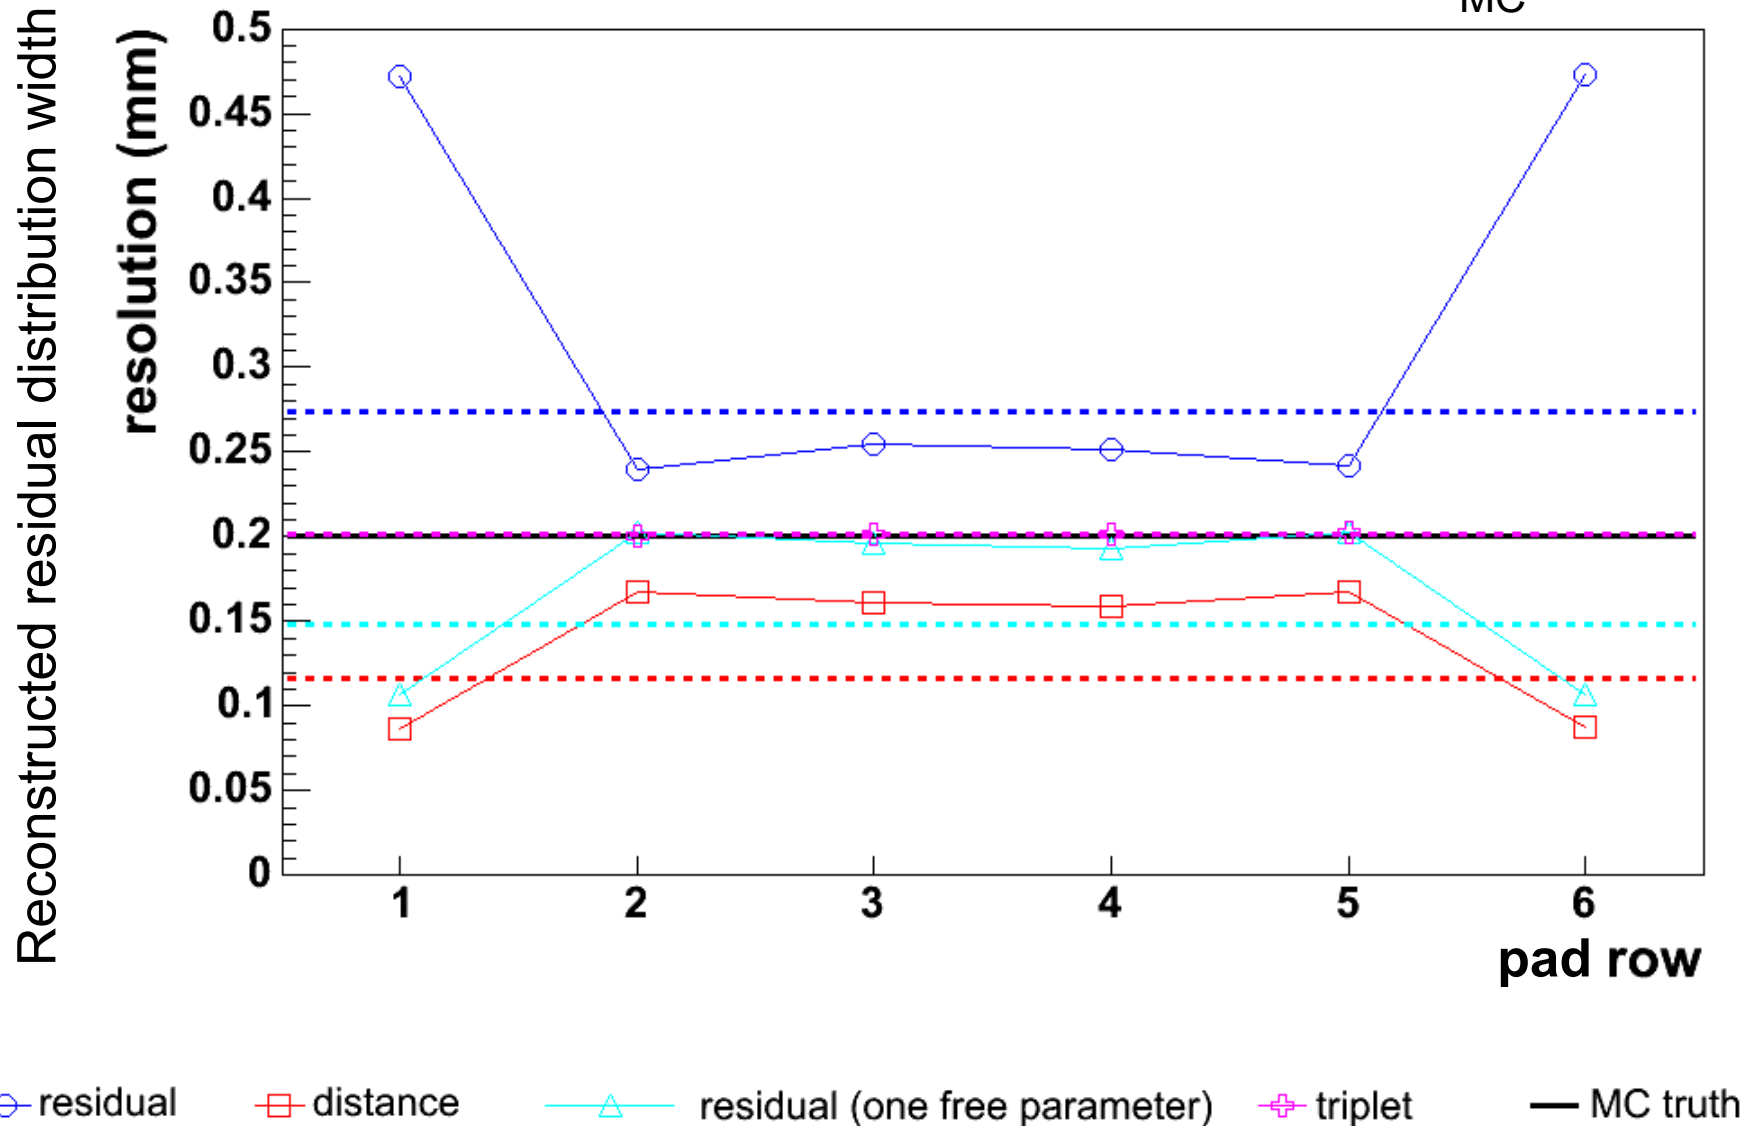

Advantages of triplet method:

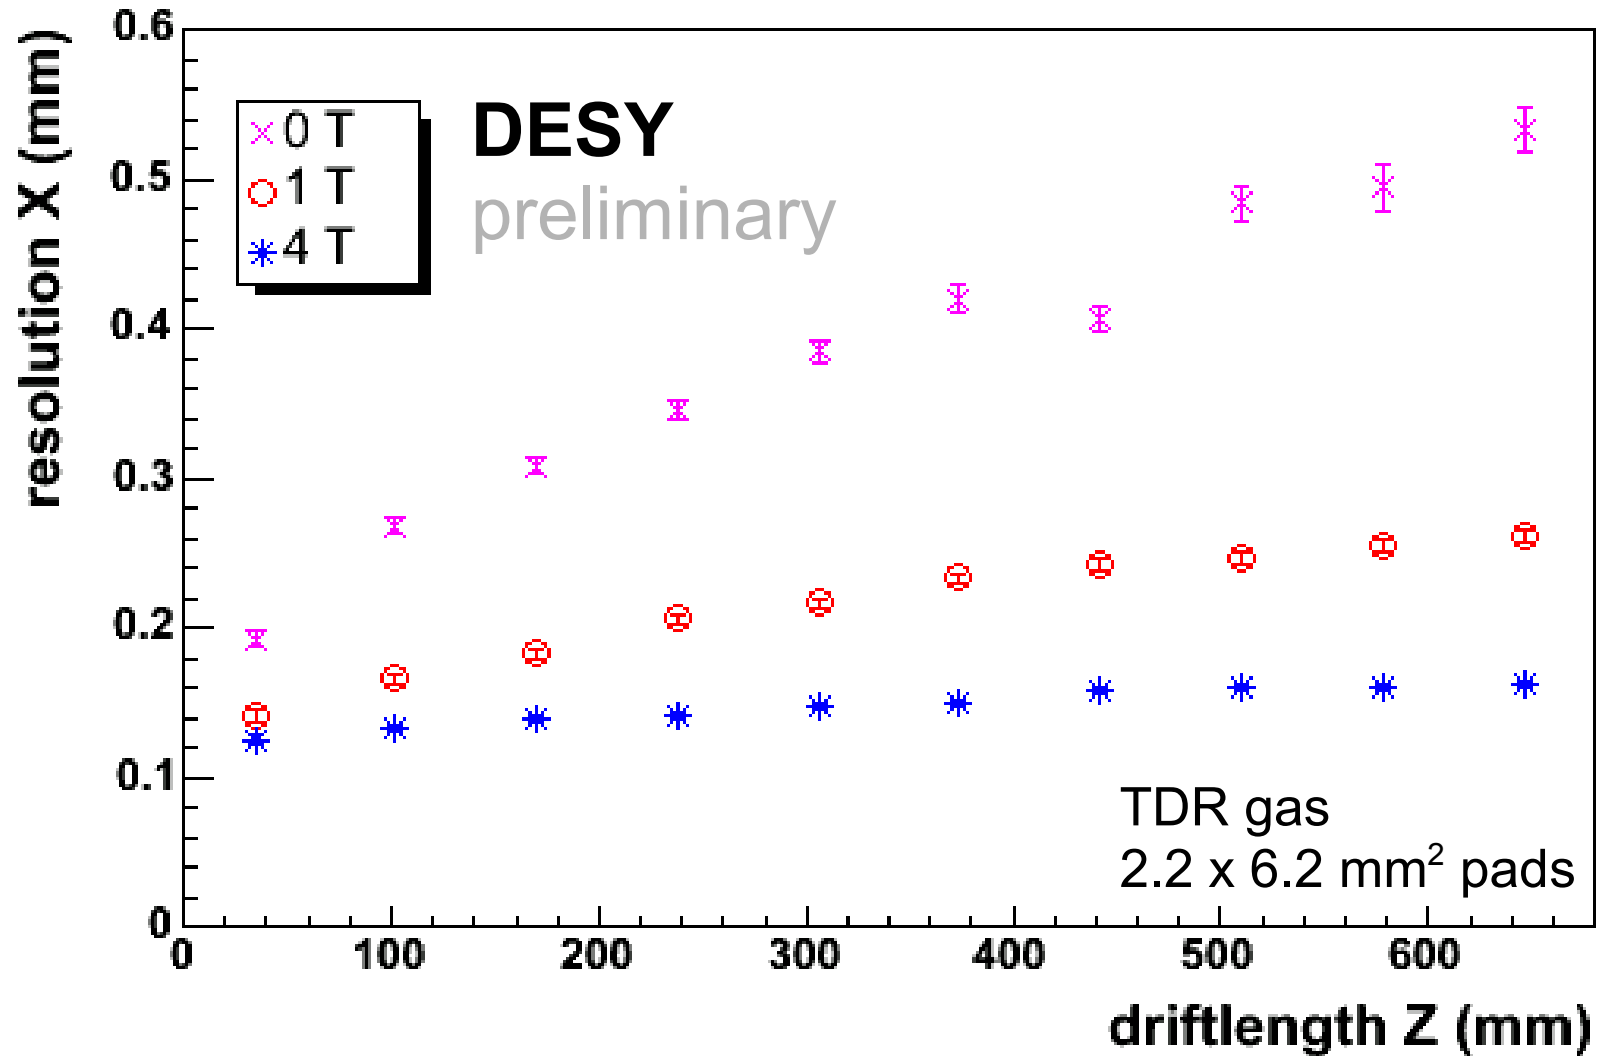

- Very simple and robust
- No difference between straight and curved tracks
- Probably less sensitive to field inhomogeneities

Triplet Method

Check with Gaussian smeared toy MC points ($\sigma_{MC} = 200 \mu\text{m}$):

Triplet Method

Marlin Tracking Module

MARLIN = **M**odular **A**nalysis and **R**econstruction for the **L**inear Collider (based on LCIO)

Current user community:

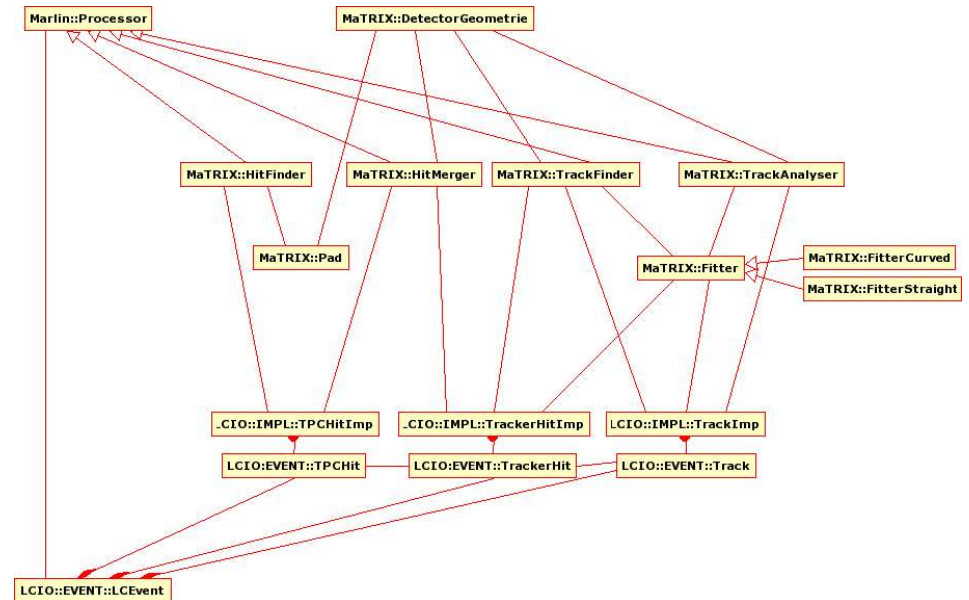

- CALICE Collaboration
- Simulation group
- Physics analysis group

Started design of MARLIN tracking processors

MaTRIX = **M**arlin based **T**rack **R**econstruction for **I**LC **E**xperiments

Your input is welcome!

Advantage of approach: Exchange of experience

Summary

- 2004 has been a successful data taking year.
- Drift velocity can be kept constant at the sub-percent level (with present simple gas system and after ~ 3 weeks of flushing).
- Continued to study resolution systematics. No final conclusions yet.
- Triplet method is a simple and robust way to determine resolution.
- Started with design of MARLIN tracking processors. Input from all groups is welcome.

Future Plans

- Determination of double track resolution with UV laser. Chamber is being modified.
- Finish slow control system.
- Add more readout channels.
- Cosmics measurements with other pad geometries and gases.
- Investigate electronics alternatives.
- Collect ideas for next generation prototype.
